Scoring table: PAM 150 Gap 11

Searched: 69111 seqs, 25083644 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: swiss-prot35 1:swiss1

Statistics: Mean 50.804; Variance 83.063; scale 0.612

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A DNA-BINDING DOMAIN AND A C-TERMINAL STEROID-BINDING DOMAIN.

- IN THE ABSENCE OF LIGAND, STEROID HORMONE RECEPTORS ARE THOUGHT TO BE WEAKLY ASSOCIATED WITH NUCLEAR COMPONENTS; HORMONE BINDING GREATLY INCREASES RECEPTOR AFFINITY. THE HORMONE-RECEPTOR COMPLEX APPEARS TO RECOGNIZE DISCRETE DNA SEQUENCES UPSTREAM OF TRANSCRIPTIONAL START SITES.

SIMILARITY: TO OTHER MEMBERS OF THE STEROID/THYROID/RETTANCYON NUCLEAR HORMONE RECEPTORS

                                                                                                                                                                                                                                                                                                                                                                        DOMAIN: COMPOSED OF THREE DOMAINS: A MODULATING N-TERMINAL DOMAIN, A DNA-BINDING DOMAIN AND A C-TERMINAL STEROID-BINDING DOMAIN. IN THE ABSENCE OF LIGAND, STEROID HORMONE RECEPTORS ARE THOUGHT TO BE WEAKLY ASSOCIATED WITH NUCLEAR COMPONENTS; HORMONE BINDING GREATLY INCREASES RECEPTOR AFFINITY. THE HORMONE-RECEPTOR COMPLEX APPEARS TO RECOGNIZE DISCRETE DNA SEQUENCES UPSTREAM OF TRANSCRIPTIONAL START SITES.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              73
                                                                                                                    SUBUNIT: HOMODIMER.

SUBCELLULAR LOCATION: NUCLEAR.

SUBCELLULAR LOCATION: NUCLEAR.

SUBCELLULAR LOCATION: NUCLEAR.

DOMAIN: COMPOSED OF THREE DOMAINS: A MODULATING N-TERMINAL DOI DOMAIN.

A DNA-BINDING DOMAIN AND A C-TERMINAL STEROID-BINDING DOMAIN.

IN THE ABSENCE OF LIGAND, STEROID HORMONE RECEPTORS ARE THOUGH TO BE WEAKLY ASSOCIATED WITH NUCLEAR COMPONENTS; HORMONE BIND GREATLY INCREASES RECEPTOR AFFINITY. THE HORMONE-RECEPTOR COMPLEX APPEARS TO RECOGNIZE DISCRETE DNA SEQUENCES UPSTREAM TRANSCRIPTIONAL START SITES.

TRANSCRIPTIONAL START SITES.

SIMILARITY: TO OTHER MEMBERS OF THE STEROID/THYROID/RETINOIC
                                                                                                                                                                                                                                                                                                                                                             KENKAMP D., JUNGBLUT P.W., THOLE H.H.;
CELL, ENDOCRINOL. 104:163-172(1994).
FUNCTION: THE STEROID HORMONES AND THEIR RECEPTORS ARE 1
THE REGULATION OF EUKARYOTIC GENE EXPRESSION AND AFFECT
